Start
Initialize Arduino connection
Read the value of voltage in thermistor
Convert the voltage to temperature.
Is the temperature less than 18°C
Decision point
Yes
The yellow LED should blink intermittently at 0.5 s intervals
Is the temperature less than 24°C
Decision point
Yes
The green LED should show a constant light.
No
The red LED should blink intermittently at 0.25 s intervals
Update the voltage of the thermistor.
Execute a loop
Loop execution
Plot the temperature vs time live photo
End the loop
End
