Start
Initialize Arduino connection
Read the current temperature.
Loop execution
Use the mathematical method to calculate the rate of temperature change.
Display the rate pf temperature rate on the screen.
Update the current temperature.
Loop execution
Predict the temperature expected in 5 minutes.
Display the current temperature and the predicted temperature on screen.
Update the current temperature change rate.
Loop execution
Is the temperature change rate less than -4°C/min (decrease)
Yes
Yellow led shows a constant light.
Decision point
No
Is the temperature change rate bigger than +4°C/min (increase)
Yes
Red led shows a constant light.
Decision point
No
Green led shows a constant light.
End loop
End
